

Methods, systems and articles of manufacture for searching content in frames. In general, information located at one or more networked addresses may be displayed to a user in two or more frames. The content of a frame may be searched by designating one frame as a default search frame. Such a designation may be made according to a tag or other criteria, such as attributes of the frame itself or historical information pertaining to a previous search of one of the active frames. In any case, the designation of a default search frame eliminates the need for explicit selection by the user prior to a search.
